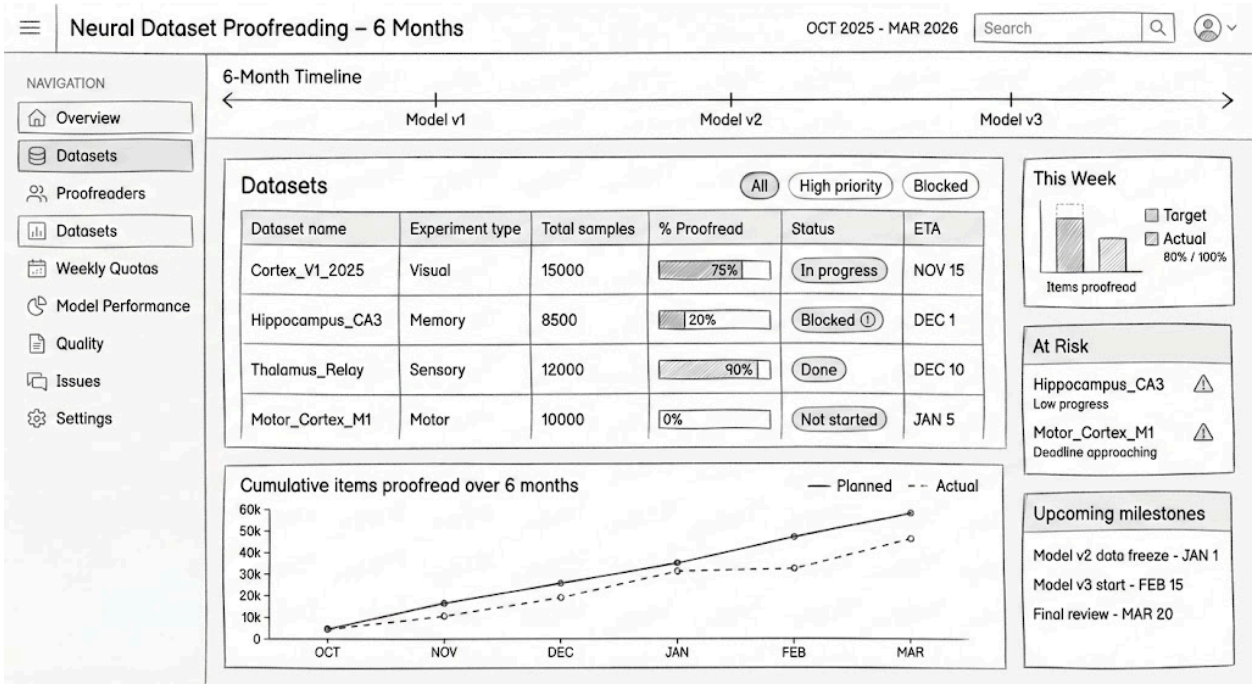
Labeling company should have it

- DL: mito proofreading+model improvement workflow sketches
    - Chatgpt Prompt:
      Generate nano banana pro prompt for sketches of the UI of project management for a neuroscientist's workflow over 6 months
      - dashboard to show the progress of proofreading for each dataset
      - showing the proofreaders' progress each week
      - send and gather weekly quota to proofreaders
      - model improvement over time: model v1, v2. Tracking the model performance
      - what else is needed for an effective data annotation/model finetuning management workflow? suppose you are a manager at Scale.AI

[role: Project manager] – Main 6-month project dashboard

UI wireframe sketch of a web-based dashboard for a neuroscientist managing a 6-month proofreading and model-finetuning project. View from a Scale.AI-style project manager.
Top bar: project title “Neural Dataset Proofreading – 6 Months”, date range, simple search box, small profile icon. Directly under it, a slim horizontal 6-month timeline with milestone markers for “Model v1”, “Model v2”, “Model v3”.
Left sidebar navigation: Overview, Datasets, Proofreaders, Weekly Quotas, Model Performance, Quality, Issues, Settings.
Main area top: large table “Datasets” with each row as a dataset. Columns: Dataset name, experiment type, total samples, % proofread (horizontal progress bar), status pill (Not started / In progress / Blocked / Done), ETA. Above table: filter chips for “All / High priority / Blocked”.
Right side column: stacked cards. Card 1: “This Week” with a mini bar showing target vs actual items proofread. Card 2: “At Risk” listing 2–3 datasets with low progress and warning icons. Card 3: “Upcoming milestones” listing next model version and data freeze dates.
Bottom area: wide chart “Cumulative items proofread over 6 months” showing planned vs actual lines.
[low-fidelity black-and-white UX wireframe sketch, hand-drawn pencil lines, clean white background, web app dashboard, rectangles and labels only, no real data, no color]



[role: Project manager] – Proofreaders' weekly progress view

UI wireframe sketch of a web app screen focused on proofreaders' weekly progress for a neuroscientist's 6-month proofreading project.

Top bar: title "Proofreaders – Weekly Progress", week selector dropdown (e.g. "Week 18"), simple filter for team / role.

Main area split vertically:

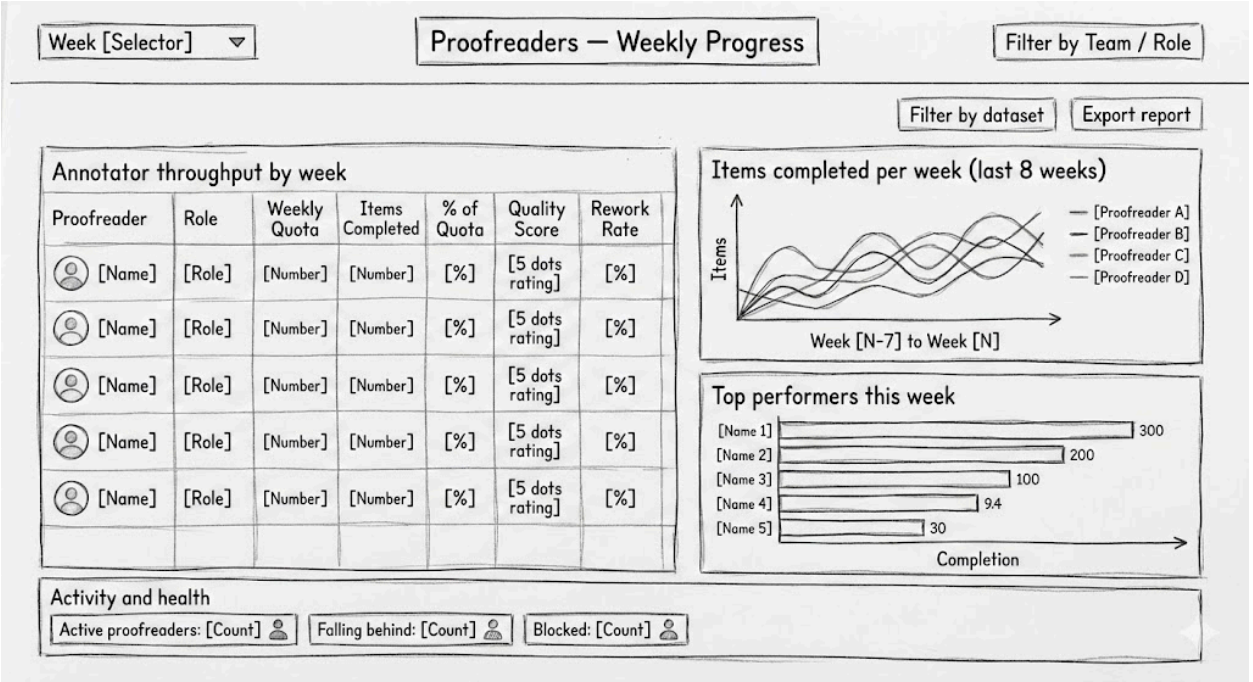
Left: table "Annotator throughput by week". One row per proofreader with avatar circle, name, role. Columns: weekly quota, items completed this week, % of quota, quality score (simple 5-dot rating), rework rate.

Right: stacked charts. At top, a simple multi-line or multi-bar chart "Items completed per week (last 8 weeks)" with one series per key proofreader. Below, a horizontal bar chart "Top performers this week" with bars for each proofreader, sorted by completion.

Bottom: narrow strip "Activity and health" with small tiles: "Active proofreaders", "Falling behind", "Blocked" with simple counts and tiny icons.

Include subtle labels such as "Filter by dataset" and "Export report" as small buttons.

[low-fidelity black-and-white UX wireframe sketch, hand-drawn pencil lines, clean white background, web app analytics dashboard, rectangles and labels only, no real data, no color]



For Proofreader: Weekly quota planning and sending (auto task assignment)

UI wireframe sketch of a quota management screen for assigning and sending weekly proofreading quotas to annotators in a neuroscientist's project management tool.

Top bar: title "Weekly Quotas", week selector (e.g. "Week 19"), small "Auto-allocate" button and "Send quotas" primary button.

Main area top: banner strip summarizing this week's goal, with three big numbers: total items to proofread, capacity estimate, % allocated so far.

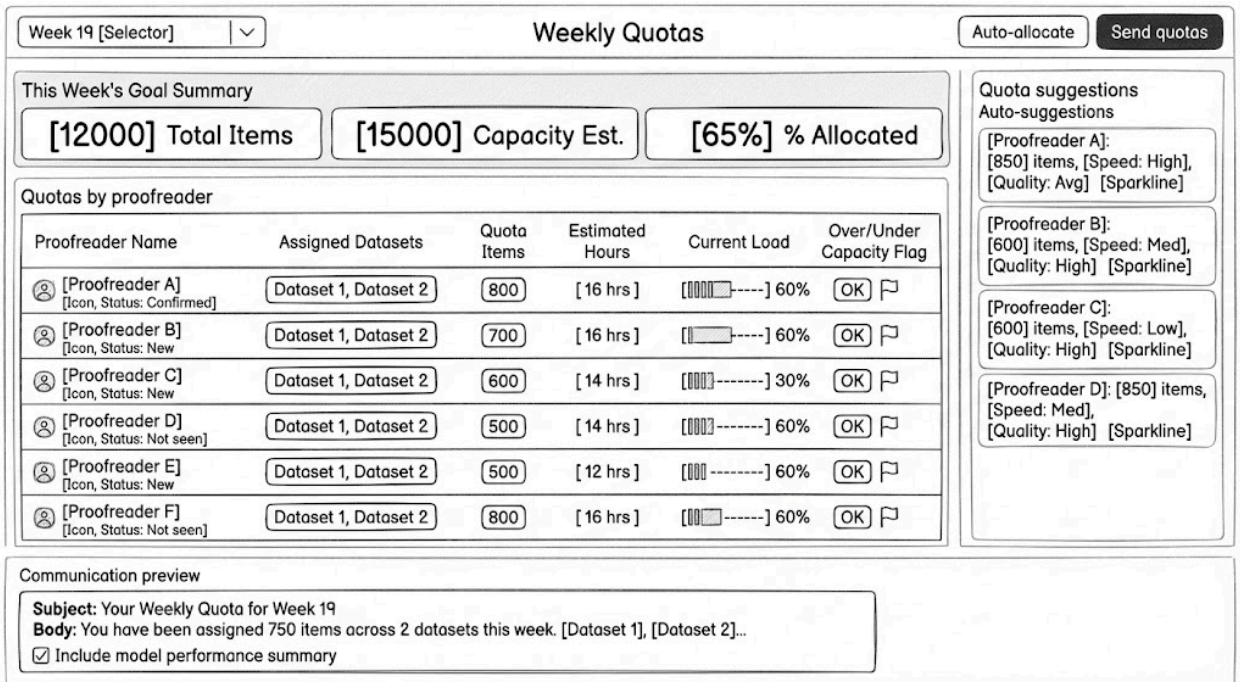
Below: large editable table "Quotas by proofreader". Columns: proofreader name, assigned datasets (compact list), quota items, estimated hours, current load (small progress bar), over/under capacity flag. Each cell looks like a simple outlined box with numeric labels.

Right side panel: "Quota suggestions" card showing auto-suggested quotas per person based on historical speed and quality, perhaps with a small sparkline for each.

Bottom: a narrow section "Communication preview" with a simple email-style block: "You have been assigned 750 items across 2 datasets this week…" and a checkbox "Include model performance summary".

Include subtle icons next to each proofreader row indicating status (new, confirmed, not seen).

[low-fidelity black-and-white UX wireframe sketch, hand-drawn pencil lines, clean white background, web app management UI, rectangles and labels only, no real data, no color]



CS ppl (button) – Model versions and performance over time (phase 1, phase 2, phase 3)

UI wireframe sketch of a model performance dashboard for tracking model v1, v2, v3 over a 6-month neuroscientific data proofreading project.

Top bar: title “Model Performance & Data Quality”, dropdowns for “Model versions” and “Evaluation dataset”.

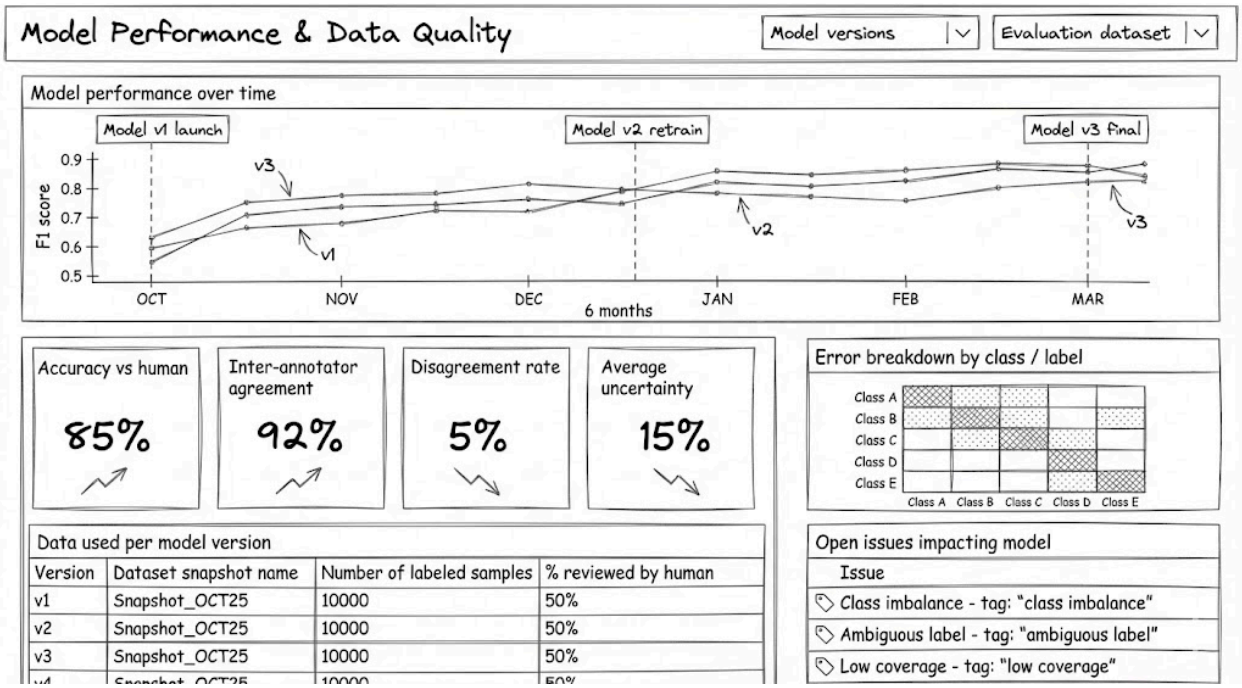
Main area top: big line chart “Model performance over time”. X-axis: dates across 6 months. Multiple lines labeled v1, v2, v3. Y-axis: metric (e.g. F1 score). Vertical dashed lines at model release dates, labeled “Model v1 launch”, “Model v2 retrain”, etc.

Below left: small metric tiles in a row: “Accuracy vs human”, “Inter-annotator agreement”, “Disagreement rate”, “Average uncertainty”. Each tile shows a big number and small trend arrow.

Below right: a confusion-matrix-style grid or heatmap sketch labeled “Error breakdown by class / label”.

Bottom: two tables side by side. Left table: “Data used per model version” with columns: version, dataset snapshot name, number of labeled samples, % reviewed by human. Right table: “Open issues impacting model” listing data-quality issues with simple tags (class imbalance, ambiguous label, low coverage).

[low-fidelity black-and-white UX wireframe sketch, hand-drawn pencil lines, clean white background, analytics dashboard, rectangles and labels only, no real data, no color]



What else is needed for an effective annotation / finetuning workflow (Scale.AI-style)

As a manager, beyond the four views above, you typically also need:

1. Quality and review workflows
    - Inter-annotator agreement, spot-check queues, second-pass review.
    - UI: “Quality” tab with review queues, reviewer assignments, agreement charts, and a table of failed items needing rework.
2. Granular issue tracking at sample and dataset level
    - Ability to flag ambiguous samples, label bugs, or guideline gaps.
    - UI: in “Issues” tab, a table linking issues to specific dataset slices, with status (Open / In review / Resolved) and assignee.
3. Labeling guideline management and versioning
    - Clear guidelines, examples, changelog of updates.

    - UI: “Guidelines” side panel accessible from every screen; version selector with “v1.3 – added rule for artifact handling”.

4. Dataset slicing and cohort analysis
    - Monitor performance and annotation progress per slice: experiment type, brain region, modality, difficulty, etc.
    - UI: filter chips and a “Slices” view showing per-slice progress and model metrics.
5. Active-learning / prioritization controls
    - Decide which items to send next to proofreaders: uncertain samples, underrepresented classes, fresh data.
    - UI: “Prioritization” panel showing queues (Uncertain, New data, Under-labeled), with toggles controlling selection rules.
6. Capacity and SLA monitoring
    - Forecast whether you hit deadlines given current throughput and team capacity.
    - UI: “Capacity” dashboard with projected completion dates per dataset, sliders for headcount / hours, and SLA flags.
7. Audit logs and governance
    - Who changed what: labels, guidelines, quotas, model config.
    - UI: “Audit log” page with chronological events and filters (user, project, dataset).
8. Experiment / finetuning tracking
    - Link each model run to code version, dataset snapshot, and evaluation results.
    - UI: “Experiments” table with rows for runs, columns for version, dataset, metrics, status, plus a detail drawer with parameters.
9. Personal annotator view
    - Per-proofreader dashboard: “My tasks”, “My quotas”, “My quality”, “Feedback”.
    - UI: simplified home screen when logged in as annotator, reusing the same data but focused on their next actions.

To bring these into your images, you can extend any prompt with phrases like:

> "…include a 'Quality' tab with review queues and an inter-annotator agreement chart, a 'Guidelines' panel with version history, and a small activity log showing recent changes to quotas and datasets."
